Existing and Proposed Overall Drainage Basin Maps	
Hydrologic and Hydraulic Data .....	App 2
Hydrologic Model (HydroCad)	

## Orientation

## Drainage Summary

This drainage summary has been prepared as a supplement to the Site Engineering Report last issued July 1, 2021 to reflect changes made to the overall drainage basin exhibit and more specifically to include ponded storage that is realized on-site at 863 Danbury Road and within the West Basin of the study area. Refer to the appendices for the overall drainage basin exhibits and the hydrologic model.

### **West Basin Existing Conditions**

In total, the west basin is  $35.71 \pm$  acres ( $7.56 \pm$  acres onsite area), of which  $4.95 \pm$  acres is impervious coverage ( $0.52 \pm$  acres onsite impervious coverage). Based upon town comments and review of the existing conditions, the west basin depicted within the hydrologic model is split into three sub-basins (W-1, W-2, and W-3) to account for ponding that occurs upstream of the existing 12" and 15" pipes.

Sub-basin W-1 consists of  $28.95 \pm$  acres ( $3.40 \pm$  acres onsite area) that is tributary to an on-site wetland/pond. Runoff from offsite areas generally sheet flow onto the subject property and eventually into the watercourse or into the town owned drainage infrastructure within Irmgard Lane and Mountain Road where it then piped directly to the head of the watercourse in the northwest corner of the site. The watercourse flows in a south/southeast direction toward the pond. The onsite runoff is tributary to the pond via overland sheet flow. The pond is metered via a headwall and 12" pipe.

The metered runoff from sub-basin W-1 discharges into an open watercourse/channel (within sub-basin W-2). Sub-basin W-2 consists of an additional  $0.83 \pm$  acres ( $0.65 \pm$  acres onsite area) of tributary area. Runoff is tributary to the watercourse via overland sheet flow. This section of watercourse is metered via an earthen berm and a 15" pipe that discharges to a downstream watercourse (within sub-basin W-3). Sub-basin W-3 consists of the remaining west basin area ( $5.93 \pm$  acres ( $3.51 \pm$  acres onsite)) which sheet flows directly into the downstream watercourse.

### **West Basin Proposed Conditions**

In general, the proposed improvements are primarily kept to the eastern portion of the property (along Danbury Road), with the exception of gravel surfaces and the proposed septic system. Site constraints include steep slopes, watercourse and wetland limits, and shallow depths to ledge and/or groundwater. Considering these constraints, the proposed onsite storm system was designed with an emphasis on maintaining peak flow attenuation and providing water quality improvements via surface treatments where practicable. To that point, a system of porous asphalt and permeable pavers are proposed.

Within the west basin, tributary area increases by 0.05 acres. The total tributary area under proposed conditions is  $35.76 \pm$  acres with  $5.00 \pm$  acres of impervious coverage (0.57 acres of which is onsite).

Sub-basin W-1 consists of  $28.91 \pm$  acres ( $3.36 \pm$  acres onsite area) that is tributary to the existing on-site wetland/pond. The offsite runoff will continue to flow into the pond as it does under existing conditions. The existing headwall and a portion of the 12" outlet pipe will be replaced (to the same elevations) as part of the proposed project.

Sub-basin W-2 consists of  $2.48 \pm$  acres ( $1.47 \pm$  acres onsite area) of tributary area. The increase in tributary area is primarily due to the expansion of the open watercourse located between the existing 12" pipe and 15" pipe. In addition, the overflow of porous basin P8 is routed to sub-basin W-2. Overflow of porous basins P6 and P7, as well as the remaining west basin area (sub-basin W-3) sheet flow directly into the downstream watercourse.

Below are tables comparing the existing and proposed water surface elevations within W-1 and W-2:

Pond 1 (Basin W-1)			
Event	Ex. WSE	Pr. WSE	$\Delta$
2-Year	342.01	341.96	-0.05
10-Year	343.63	343.60	-0.03
25-Year	343.93	343.91	-0.02
100-Year	344.27	344.26	-0.01

Pond 2 (Basin W-2)			
Event	Ex. WSE	Pr. WSE	$\Delta$
2-Year	340.01	339.44	-0.57
10-Year	342.60	341.74	-0.86
25-Year	342.86	341.89	-0.97
100-Year	343.14	342.05	-1.09

Below are the revised peak rates of runoff for the 10 and 25-year storm events, as taken from the included Hydrocad model:

Storm Event (year)	East Basin			West Basin		
	Existing Conditions (cfs)	Proposed Conditions (cfs)	Reduction from Existing (%)	Existing Conditions (cfs)	Proposed Conditions (cfs)	Reduction from Existing (%)
10	47.28	46.66	-1.3	<b>32.43</b>	<b>31.81</b>	<b>-1.9</b>
25	67.69	67.07	-0.9	<b>58.92</b>	<b>58.52</b>	<b>-0.7</b>

Storm Event (year)	Overall Study Point		
	Existing Conditions (cfs)	Proposed Conditions (cfs)	Reduction from Existing (%)
10	<b>68.33</b>	<b>63.74</b>	<b>-6.7</b>
25	<b>120.80</b>	<b>119.31</b>	<b>-1.2</b>

Note, the revised model represents a net decrease in flow between existing and proposed conditions, therefore no changes were made to the proposed stormwater collection system. The design details and further calculations for the above-mentioned porous basins are located within the Site Plan package and original version of the Site Engineering Report.

## **Conclusion**

The proposed storm water management system is designed to accommodate a "25-year" storm and provide water quality improvements. Pursuant to the proper implementation of the design plans, there will be no adverse impacts to adjacent or downstream properties or town/state facilities from the proposed development.
